

Time Reporting Plus

Enterprise Smartphone/Tablet App

PRODUCT DATASHEET

Time Reporting Plus allows workers to enter and track machine and/or employee time, quantity produced, scrap quantity, scrap code and more. It eliminates the need for printing paper by making shop order information instantly available on a smartphone or tablet. Work orders can be color coded by priority and workers are alerted when they are approaching or go over their allotted time for production.

How it works:

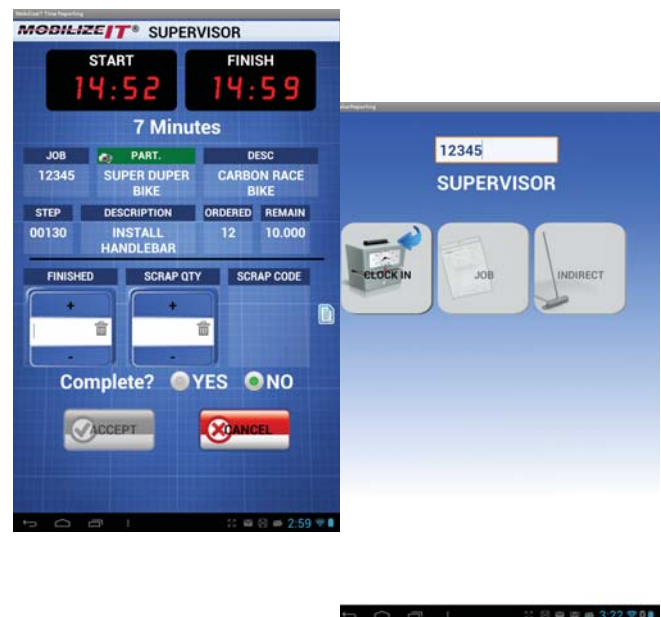

The enterprise work order/employee fields are mapped to the Mobilize-IT Time Reporting import template and the Time Reporting information is made available to the smartphone or tablet by the Mobilize-IT (middleware). The Mobilize-IT Time Reporting app allows the user to access the work order to verify operation information and to record the time and quantity. The completed Time Reporting information can be sent back to the middleware server and stored in the database for reporting or updating the labor, order quantity and scrap into the ERP system via the export mapping template.

Benefits:

- Tracks workers and machines
- View current shop order status
- Improves accuracy
- Eliminates paper and re-keying
- Real time answers
- Reduce time managing shop packets

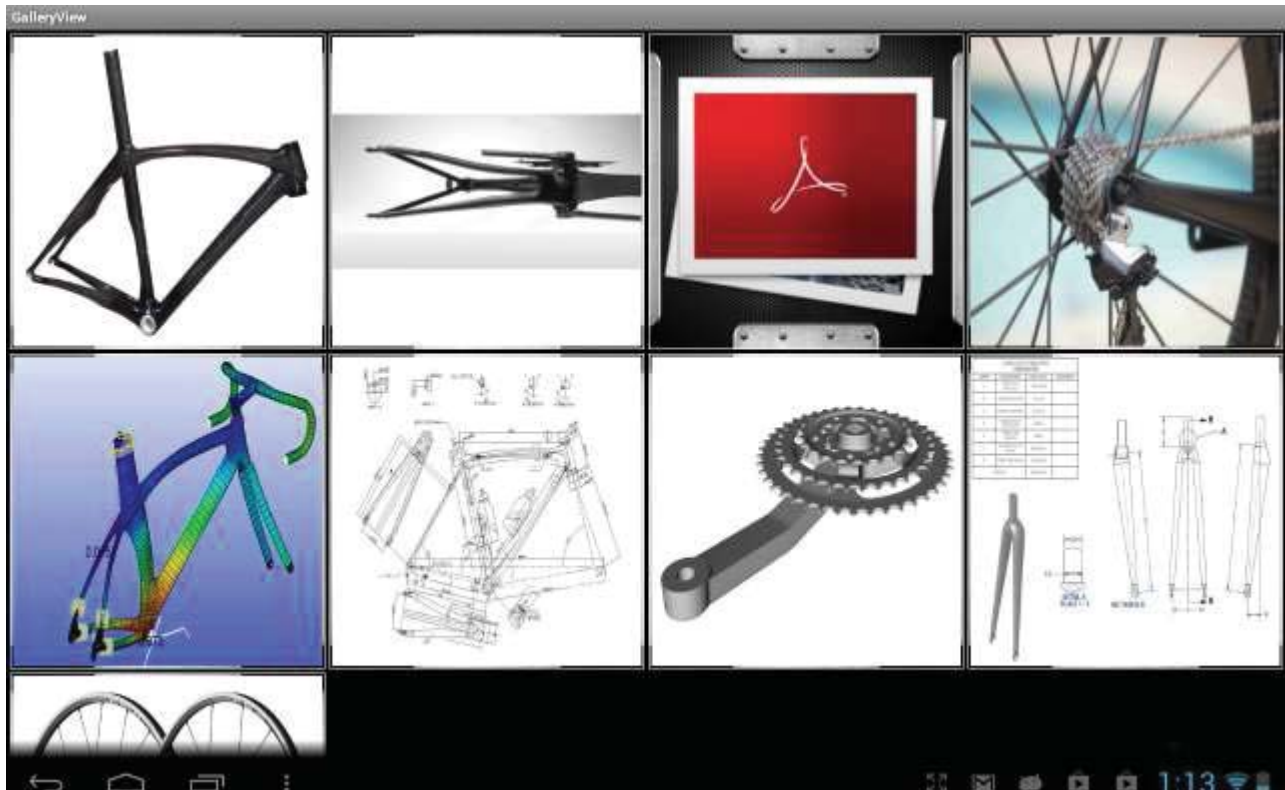

Features:

- View shop routing and bill of material
- Alerts for going over allotted production time
- Eliminate printing shop packets
- Multiple lookups
- Collects direct and indirect labor
- Fast entry with control buttons or on-screen keypad
- Start and finish clock display
- Color coded orders by priority
- Elapsed time display
- Record notes
- Bar code entry (optional)
- Accepts ERP files (CSV or XML)
- Display virtually any file types including drawings and video clips

TIME REPORTING PLUS

The Dispatch Document Retrieval function is incorporated into the Time Reporting Plus app. You can indicate which data elements will contain the information needed to accurately query the network to know what documents are relevant for your needs. For example, if you store your CAD drawings on the network using the part number as the name of the document, the system can be told to look for the documents with part number in the name. This can apply to not only the drawings but any pictures, videos, etc. Routings, parts, drawings, quality info, set up instructions, video clips and pictures are listed by order number or part and immediately available for display. By tapping on the screen you can display just about any type of file (e.g., Word, Excel, PDF, pictures) or video available on your mobile device.

The system searches for the most current information and latest revisions eliminating the need to update and print paper travelers and maintain work order binders. You can realize immediate and tangible savings alone on paper and printer maintenance while adding to sustainable and green initiatives. The user screens are easy to use and fast to operate keeping training time to a minimum.
