# Aircraft Engine Manufacturer Begins Implementation of New ERP System

**Brookfield, WI — January 2, 2019 — [Guardian Business Solutions, Inc.](#)**, a Wisconsin based Infor Partner of comprehensive Enterprise Resource Planning (ERP) solutions, has kicked off implementation for [DeltaHawk](#) Engines Inc., an innovative aircraft engine manufacturer in Racine that builds engines for general aviation aircraft. The new ERP system will provide the technology foundation to manage their production operations and provide the flexibility for future growth.

Having previously implemented off-the-shelf ERP, the company found themselves with restrictive technology that did not fully support their requirements. As the company continues to grow, the team at DeltaHawk saw a need for a systems improvement that could meet their evolving business and quality requirements and allow them to innovate in the Aerospace market. DeltaHawk's Director of Operations noted "Our ERP selection team did a comprehensive review of all ERP systems advertising support for aerospace applications, and after a length evaluation, we selected Infor CloudSuite Industrial as the best fit for both our near and long term needs."

It was important that this be done with an ERP solution that didn't require a lot of IT support or customizations and could be implemented by an implementation team that understood the challenges of the Aerospace industry. DeltaHawk's competitive advantage lies in its ability to innovate and being able to do the things that others cannot. With Guardian, they have found a partner that will provide them with the functionalities necessary to standardize their processes and help support their quality requirements.

Utilizing CloudSuite Industrial ERP, DeltaHawk will be able to manage all its operations from within a single system. This will include inventory management, purchasing, production and scheduling, accounting and finance, sales and order entry, quality control, warehousing and shipping, and service management which will provide their Services division with the ability to track warranty, service and part replacements. The company

will also utilize the platform's shop floor execution capabilities to manage its assembly operations and quality testing.

Among the reasons why the Guardian/Infor solution was chosen, was because the company demonstrated its understanding and expertise of the Aerospace industry. It was important to DeltaHawk that they worked with a vendor that had knowledge of the Aerospace industry that DeltaHawk conducts its business in. Not only did they need to choose the right technology solution that met their needs, but they wanted to make sure they would be working with the right people behind it.
